

## **CC10-KS**

## **KCl Substitute**

CC10-KS is a clay stabilizer designed to minimize formation damage that can occur when treatment fluids interact with clays imbedded in formation. CC10-KS is polymer based and can also control migrating fines through agglomeration preventing formation damage and increasing production.

### Features and Benefits

- ✓ Low freeze temperature (-40°C)
- ✓ Protects swelling and migrating clays from fresh water damage
- ✓ Compatible with anionic fracturing additives
- ✓ More effective than typical solutions of choline chloride fluids

### Applications

- ✓ Typically added at 1 l/m<sup>3</sup>
- ✓ Can be used in all fracturing, acidizing or coil fluids
